

# M-FILES FOR MANUFACTURING

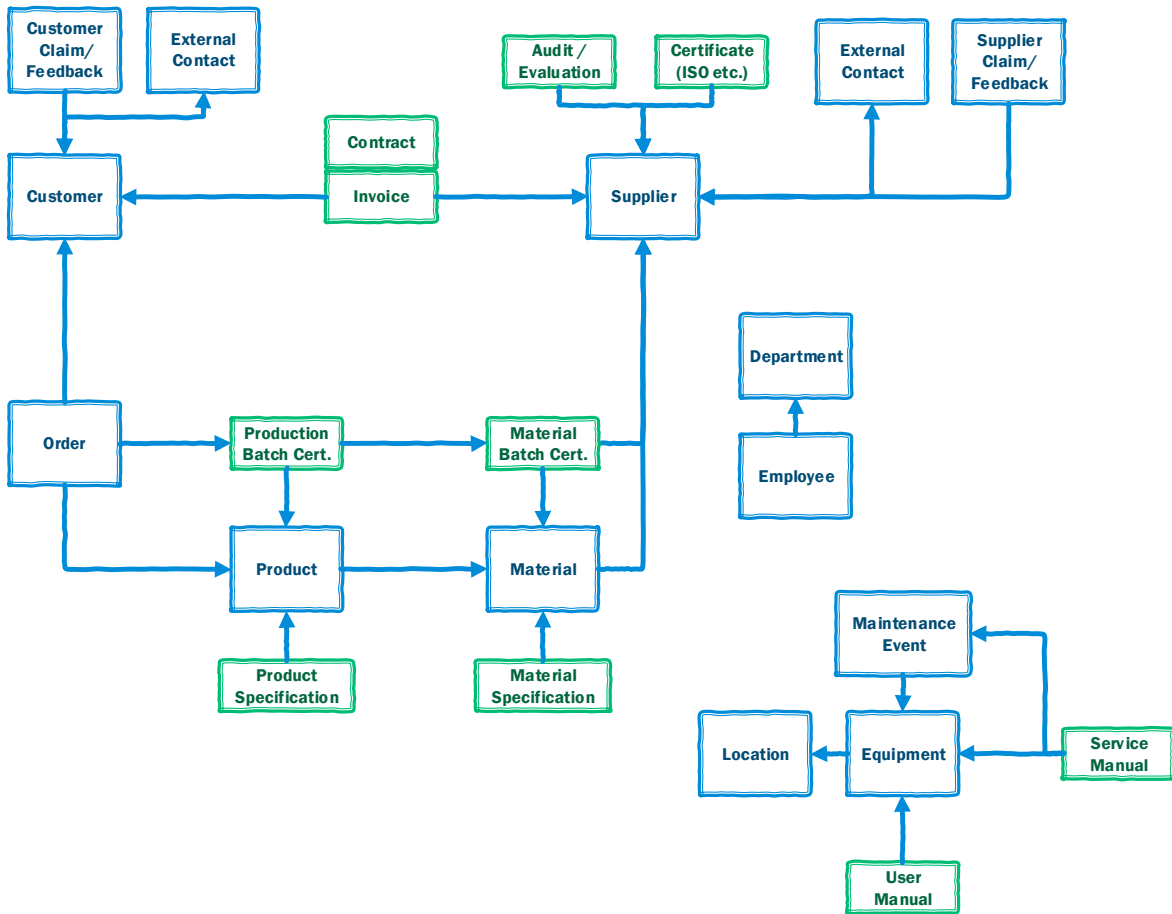

VERSION 1.1 | LAST UPDATED 24 NOVEMBER 2020

## 1. Short Description

In this demo scenario we have a company *Fashion 4 U International* that is using M-Files to manage its manufacturing related documents. This company is in the textile industry where it manufactures clothes in factories and acquires fabric as raw material from suppliers. This hypothetical system landscape includes ERP and CRM systems (not present in demo) that contain master data for customers, suppliers, orders etc. and these systems are synchronized to M-Files where all company documents are managed or just shared as read-only (e.g. production batch certificate).

There are a fair amount of object types and quite a lot of objects in the vault. **The data setup tries to illustrate one of the challenges that is common to the manufacturing industry - maintaining visibility and connecting information throughout the entire supply chain.** In manufacturing, data is often scattered in silo systems and with this sort of environment, information can't flow throughout the supply chain. The objects, relationships and content try to emphasize data complexity, but people in the manufacturing industry (especially in textiles) will most likely find missing data and consider this an oversimplification. This should not be considered an overall best-practice solution for the manufacturing industry, instead this is meant to show one way solve certain use-cases and act as starting point for discussions.

Note: As there are quite a lot of object types and data in the vault, it is encouraged to show only those parts that are most relevant for the customers.
